Aim: Implementation of Dimension and Fact tables and perform OLAP operations.

Objective: OLAP stands for Online Analytical Processing. The objective of OLAP is to analyze information from multiple database systems at the same time. It is based on multidimensional data model and allows the user to query on multi-dimensional data.

Theory:

- Online Analytical Processing Server (OLAP) is based on the multidimensional data model.
- The main aim of OLAP is to provide multidimensional analysis to the underlying data.

Following is the list of OLAP operations:

1. Roll-up
2. Drill-down
3. Slice
4. Dice
5. Pivot (rotate)

Roll-up:

- The roll-up operation (also called the drill-up operation) performs aggregation on a data cube, either by climbing up a concept hierarchy for a dimension or by dimension reduction.
- Figure 2.1 shows the result of a roll-up operation performed on the central cube by climbing up the concept hierarchy for location.
- This hierarchy was defined as the total order “street < city < province or state < country.”
- The roll-up operation aggregates the data by ascending the location hierarchy from the level of city to the level of country.
- In other words, rather than grouping the data by city, the resulting cube groups the data by country.

Drill-down:

- Drill-down is the reverse of roll-up. It navigates from less detailed data to more detailed data.
- Drill-down can be realized by either stepping down a concept hierarchy for a dimension or introducing additional dimensions.
- Figure 2.1 shows the result of a drill-down operation performed on the central cube by stepping down a concept hierarchy for time defined as “day < month < quarter < year.”
- Drill-down occurs by descending the time hierarchy from the level of quarter to the more detailed level of month.
- The resulting data cube details the total sales per month rather than summarizing them by

quarter.

Figure 2.1: Examples of typical OLAP operations on multidimensional data.

Slice:

- The slice operation performs a selection on one dimension of the given cube, resulting in a subcube.
- Figure 2.1 below shows a slice operation where the sales data are selected from the central cube for the dimension time using the criterion time = "Q1."

Vidyavardhini's College of Engineering and Technology

Department of Artificial Intelligence & Data Science

Dice:

- The dice operation defines a subcube by performing a selection on two or more dimensions.
- Figure 2.1 shows a dice operation on the central cube based on the following selection criteria that involve three dimensions: (location = "Toronto" or "Vancouver") and (time = "Q1" or "Q2") and (item = "home entertainment" or "computer").

Pivot:

- Pivot (also called rotate) is a visualization operation that rotates the data axes in view to provide an alternative data presentation.
- Figure 2.1 shows a pivot operation where the item and location axes in a 2-D slice are rotated.

Problem Statement:

We are tasked with designing and implementing a data warehousing solution for an E-commerce company. Our objective is to create Dimension and Fact tables and perform OLAP (Online Analytical Processing) operations for data analysis.

Output:

1. Creating the Dimension Tables

The screenshot shows an SQL Worksheet interface with a toolbar at the top containing 'Clear', 'Find', 'Actions', 'Save', and 'Run' buttons. The main area displays SQL code for creating a table named 'OLAP'. The code is as follows:

```
1 CREATE TABLE OLAP
2 (
3     CUST_ID          NUMBER(3)    PRIMARY KEY,
4     CUST_NAME        VARCHAR2(20),
5     NO_OF_PRODUCTS   NUMBER(3),
6     STORE_NAME        VARCHAR2(54),
7     STORE_LOCATION    VARCHAR2(25));
```

Below the code editor, a message box states 'Table created.'

Department of Artificial Intelligence & Data Science

2. Creating the Fact Table

```
SQL Worksheet
```

```
1 CREATE TABLE PRODUCTSLES
2 ( TRANSACTION_ID VARCHAR2(20) PRIMARY KEY,
3   INVOICE_NO VARCHAR2(10),
4   TOTAL_AMOUNT VARCHAR2(10),
5   CUSTOMER_ID VARCHAR2(10) REFERENCES CUSTOMER(CUSTOMER_ID),
6   PRODUCT_ID VARCHAR2(10) REFERENCES PRODUCT(PRODUCT_ID),
7   STORE_ID VARCHAR2(10) REFERENCES STORE(STORE_ID),
8   SALESPERSON_ID VARCHAR2(10) REFERENCES SALESPERSON(SALESPERSON_ID)
9 );
10
11 INSERT INTO PRODUCTSLES VALUES('1', '501', '1678', '4', '3', '5', '2');
```

Table created.

1 row(s) inserted.

3. Inserting values in both dimension and fact tables

```
SQL Worksheet
```

```
1 INSERT INTO OLAP VALUES ('1', 'ARCHIT KONDE', '2', 'Star Bazzan', 'THANE');
2 INSERT INTO OLAP VALUES ('2', 'SAAKSHI DEOKAR', '1', 'DMart', 'GOREGAON');
3 INSERT INTO OLAP VALUES ('3', 'HASAN RIZVI', '4', 'DMart', 'THANE');
4 INSERT INTO OLAP VALUES ('4', 'MEGA MODHA', '3', 'Big Bazaar', 'GHATKOPAR');
5 INSERT INTO OLAP VALUES ('5', 'MAYURESH PHANSIKAR', '2', 'DMart', 'SEAWOODS');
6 INSERT INTO OLAP VALUES ('6', 'INJILA HUSSAIN', '1', 'Big Bazaar', 'KURLA');
7 INSERT INTO OLAP VALUES ('7', 'SAURABH KILLEKAR', '2', 'Hyper City', 'THANE');
8 INSERT INTO OLAP VALUES ('8', 'SAKSHI KHARE', '1', 'Star Bazzan', 'GHATKOPAR');
```

1 row(s) inserted.

1 row(s) inserted.

1 row(s) inserted.

1 row(s) inserted.

1 row(s) inserted.

1 row(s) inserted.

1 row(s) inserted.

1 row(s) inserted.

Department of Artificial Intelligence & Data Science

5. Write SQL Queries for all the above OLAP operations.

1. Roll up

```
SELECT STORE_NAME, SUM(NO_OF_PRODUCTS) AS TOTALPRODUCT FROM OLAP  
GROUP BY STORE_NAME;
```

2. Drill Down

```
SELECT CUST_ID,CUST_NAME,NO_OF_PRODUCTS, STORE_LOCATION FROM OLAP;
```

3. Slice

```
SELECT * FROM OLAP WHERE STORE_LOCATION='THANE';
```

4. Dice

```
SELECT * FROM OLAP WHERE NO_OF_PRODUCTS=2 AND  
STORE_LOCATION='THANE';
```

Conclusion:

In summary, OLAP operations are essential for exploring data, controlling granularity, and enabling flexible, efficient, and informed decision-making. They empower organizations to analyze historical data, forecast trends, and integrate with BI tools. Continuous learning and adaptation to emerging best practices are key to maximizing the benefits of OLAP in data analysis and decision-making.
